

Recursion ↳ when a function calls itself

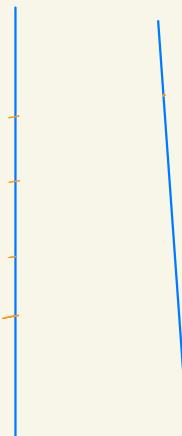

- 1) steps
- ⇒ solve it for the smallest problem.
 - ⇒ Assume that it will work properly for smaller problem (faith)
 - ⇒ Solve it for a smaller solution (your work)

Ques Take an input x , print numbers from x to 1.

⇒ public static void fun(int x) {
 if ($x == 1$) {
 base case
 System.out.println(x);
 return;
 }

step ① ↓
 {
 if ($x == 1$) {
 base case
 System.out.println(x);
 return;
 }
 }
 ↓
 Sys.out(x);

step ② ↓
 fun(x-1);
 ↓
 {

$x-1$

Expectation

it will print numbers from x to 1
properly

work

✓ Faith

it will print numbers from $(x-1)$ to 1

$x=5$

Ques Write a function to find factorial $n!$

expectation

(n=5)

It will return 120
 $n!$

$5 \times 4 \times 3 \times 2 \times 1$

public static int fac (int n) {
 if (n == 0) return 1;

faith

It will return
 $(n-1)!$

- 1) int f = fac (n-1);
- 2) int ans = n * f;
- return ans;
- }

$4 \times 3 \times 2 \times 1$
↓
24

Ques Write function to calculate a raise to power b

Expectation $a=2$
 $b=4$

It will calculate and
return a^b

$$\begin{matrix} 2^4 \\ \downarrow \\ 2 \times 2 \times 2 \times 2 \end{matrix}$$

ps int power(int a, int b){
1) if ($b==0$) return 1;
2) int f = power(a, b-1);
3) int ans = a * f
return ans;

Faith

It will calculate
 a^{b-1}

$O(b)$

}

Expectation $a=2, b=4$

It will calculate a^b .

$$\overbrace{2 \times 2 \times 2 \times 2}$$

$$ans = f \times f$$

ps int powerWith (a, b){
1) if ($b==0$) return 1;
2) int f = pb(a, b/2);
3) int ans = f * f;
if ($b \cdot 1.2 == 1$)
ans = a * ans;
return ans

$O(\log b)$

}

$$f=9$$

$$\begin{aligned} ans &= 9 \times 9 \times 81 \\ ans &= 3 \times 81 \Rightarrow 243 \end{aligned}$$

main {
 a=2, b=1
}

$\boxed{a=3, b=5}$ $\boxed{243}$

$$b \rightarrow \frac{b}{2} \rightarrow \frac{b}{4} \rightarrow \frac{b}{8} \dots \dots \dots \textcircled{1}$$

$$\frac{b}{2^1} \rightarrow \frac{b}{2^2} \rightarrow \frac{b}{2^x} \dots \dots \dots \left(\frac{b}{2^x} \right)$$

$$\frac{b}{2^x} = 1 \Rightarrow b = 2^x$$

$$\Rightarrow \frac{\log b}{\log 2} = x \log 2$$

$$\boxed{x = \frac{\log b}{\log 2}}$$

Ques Print array using recursion

$$\text{arr} = [10, 29, 11, 5, 43]$$

Expectation
Print elements from index 0

to $(n-1)$:

10

29

11

5

43

Faith

Print elements from index
1 to $n-1$

\downarrow ($\text{idn} = \text{arr.length})$ return

Ques Find max of an array using recursion.

arr = { 0 1 2 3 4
 10, 9, 4, 7, 6 } → [Integer MIN Value]

Intuition

It will find the maximum element b/w (0 - 4) index.

Faith

It will find the maximum element b/w (1-4) index.

9

if max (int[] arr, int `idx`){

1) int max-age = max (arr, idx+1)

2) int ans = Math.max (arr[idx], max-age);
return ans

Ques Find at which index, tar exists -
 arr = {1, 2, 11, 9, 45}
 0, 2, 3, 4
 tar = 9, ans = 3
 tar = 12, ans = -1

Expectation

It will find idx of tar b/w
 0 and 4

```
// tar=7 0 1 2 3 4 5 6
// arr={2,3,5,7,5,7,24};
public static int find_rec(int[] arr, int idx, int tar){
    1) if(idx==arr.length){
        return -1;
    }

    2) int f=find_rec(arr, idx+1,tar);

    3) if(f==-1){
        if(arr[idx]==tar){
            return idx;
        }
    }

    4) return f;
}
```

Fault

It will find idx of tar
 b/w 1 and 4

⇒ last occurrence

⇒ first occurrence
